The method advocated is to harrow the soil deeply in preparing the land with a disc harrow, then to let the land rest for has been applied the year before. But

possible, says W. H. Peters professor and start the weeds growing. The same at the University of and start the weeds growing. The amountable of the succession of the successi

bad weeds. Plants are usually set about two feet apart in the row with the rows spaced three to four feet. Keep the plants well heed throughout the season and allow the runners to form and root.

Most people prefer red raspberries, and ese Early June and Cuthbert are excellent varieties. However, for hardiness, yield and good quality, the Columbian is dard to beat. Set plants now and allow at least five feet apart between rows for garden culture. A light two-wire trellis for the support of the canes is excellent and make for restricted.

and makes for neatness in garden effect. EARLY SEEDING IS

HELPFUL TO OATS Early s-ofting of outs always gives a larger yield of both straw and seed for the cool, moist olimate of early string does not much the foliage of the outs as a warm dry season dors. Late scaling, even if the oats are haved, may so delay ripening that the harvest will have to take place during the rainy season, which generally comes after July.

Among other factors affecting the yiel-

OUALITY * PURI

One expert points out the importance one expert points out the incomment of carefully screening to eliminate all weed seed and pin-head oats, because these small seed which are not plump an ifull of plant food, even if they germinate will never amount to anything in yield.

The state of the s

ings for hadwins and nimitar varieties of applies not so subject to disease," says one horticultural agent. He goes on to cay that "white this may seem to imply considerable work and expense, it should be weaked from the remembered that careful apraying lays by biggest, surest and quickest returns of any orchard operation. There is a tremandous increase in value of the drup due to better quality and this uncludedly is the largest gain, but the increase in quantity of crop alone would make coraying pay, even were it all sold as clear or vinegar stock."

Now is the time for the first application of the draw domain spray blanned to kill off scale insects, blister in the apple scale distance Many farmers have applied this spray already. It consists of the complaying of the following materially and any farmers are of the pasture of it that is not available, they might better be put right on a beauty grain feed and sold as soon as they grain feed and sold as soon as the delayed dormant spray beautiful of the pasture of the substitute of the substitute of the first application of the delayed dormant spray.

Now is the time for the first application of the apple scale distance Many farmers are the plants of the delayed dormant spray.

Now is the time for the first application of the apple scale distance Many farmers are plants and present the following material type and the substitute of the substitute of the control of the substitute o

a week or so, after which it should be gone over with the amoothing harrow until the corn is planted. There should be sowed as it has a tendency to weaken the deep cultivation after the first harrow—straw. If outs are to be planted on land the straw of the same to be planted on land the second straw. that has had manure applied the year be As Prof. Abbott pointed out, the deep fore a heavy application of fertilizer, the ultivation at first will warm up the soil use of acid phosphate or law grade ferti
